P_{DSM}	Instantaneous overload dissipation	$T_{mb} = 25 \text{ }^\circ\text{C}$	-	1.3	kW

OVERVOLTAGE CLAMPING LIMITING VALUES

At a drain source voltage above 50 V the power MOSFET is actively turned on to clamp overvoltage transients.

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
I_{DROM}	Repetitive peak clamping current	$V_{IS} = 0 \text{ V}$	-	29	A
E_{DSM}	Non-repetitive clamping energy	$T_{mb} \leq 25 \text{ }^\circ\text{C}; I_{DM} = 27 \text{ A};$ $V_{DD} \leq 20 \text{ V};$ inductive load	-	625	mJ

V_C	Electrostatic discharge capacitor voltage	Human body model; $C = 250 \text{ pF}; R = 1.5 \text{ k}\Omega$	-	2	kV

1 Prior to the onset of overvoltage clamping. For voltages above this value, safe operation is limited by the overvoltage clamping energy.

2 A higher T_j is allowed as an overload condition but at the threshold $T_{j(TO)}$ the over temperature trip operates to protect the switch.

3 The input voltage for which the overload protection circuits are functional.

4 The device is able to self-protect against a short circuit load providing the drain-source supply voltage does not exceed $V_{DDP(P)}$ maximum. For further information, refer to OVERLOAD PROTECTION CHARACTERISTICS.

¹ The short circuit load protection is able to save the device providing the instantaneous on-state dissipation is less than the limiting value for P_{DSM} , which is always the case when V_{DS} is less than V_{DSP} maximum. Refer to OVERLOAD PROTECTION LIMITING VALUES.

² The over temperature protection feature requires a minimum on-state drain source voltage for correct operation. The specified minimum I_D ensures this condition.

³ The input voltage below which the overload protection circuits will be reset.
